

Mon: 9/29/25

Weekend was dry, small showers.

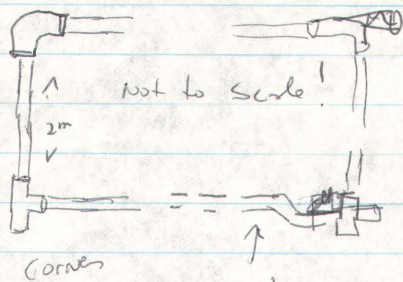

Monday showed a SAM, units wet, sucked out shells also in

for Dep units w/ vacuum on swing hose (no more than 1" max) hose sucked some air obviously.

Wet muddy surfaces of units, sub surface wet + sticky (stuck to shovels), but not 'mucky'. Under boards used for walkways, also seeps were common. Under walking-weight pressure.

units a bit out of out of ~~beats~~ square -
 talking to will + thal + mike k + ^{cross k} rei.
 Solution. Mike suggests "batten boards",
 sounds good. We also try out a 2x2 meter
 'socketed' snap together pipe square
 to have an instant 2x2m template

90° Square corners!

(corner socketed so 2 can snap
 together to form
 4x2

red brown part firmly established
 140cm in all units - characteristic
 chunks of wood, some ~ 20cm long, palmately,
 around caps, oak? + willow? leaf mats; still
 low of fauna tho, at least to eye. rain in
 Am Bummer!
