

Wed 10/2

Squared off units at west end of pond, working E using grid + tree lines strong yesterday.

Elizabeth Ferguson + T. Park in Oct 206

found 6<sup>th</sup> level west (humerus). (appears <sup>exactly</sup> identical), at least 15' (150 cm) W of PD

on 2.56 m<sup>2</sup> (clearly in Red Brown) but isolated a unit to E, near to

tooth hole H2 (i.e. L01224) are deeper; (~180 m<sup>2</sup>), but still no bones.

West to just flat.

roughly all units are at about 140m or deeper, red brown

foam solid.

BK nodes brought by a carrier to look at, probing, malle, concave, & pitting of mud cracking. Mud so thin extent of mud except temporary which are partly fossil. 'rice' groove on open interior, veins, parallel channels, cellular honey.

BK wants to come out, told to call M. Coen
